

My Plan

Giant Panda's

By: Gabrielle Nealon

WALT: Explain

My Learning Goal: Use specific detail per paragraph & PLAN properly

My first ideas

Pandas. I think pandas are huge animals that have a small diet of mostly bamboo or plants. I think that when pandas eat they snap or brake the item of food that they have found then eat it . Panda's are not very harmful unless they have a baby under the age of 3 months around them.

No apostrophe here Gabby.

WALT: Explain

Introduction

The Giant Panda is a universally loved animal that is endangered. It is a member of the bear family even though it is a vegetarian: it eats bamboo. **The Giant Panda is one of the most treasured animals in China-the Giant Panda is a native animal to china. In fact, it is the national symbol of the Chinese zoo in Beijing.**

The Special Features

The Giant Panda is endangered, with an estimated amount of 2,000 pandas left in the wild, by the end of 2006 only 180 pandas were left in captivity. Which means that there are one thousand eight hundred and twenty left out in the dangerous wild of China.

The Giant Panda is a very interesting animal. The wild Giant Panda has many addictions, their habitat which is usual around bamboo. The Giant Panda eats bamboo for ninety nine percent of their diet. Bamboo is a green bumpy stick like plant that Panda's enjoy eating on a daily basis.

Appearance

The giant panda is a big over weight mammal that is five times a large mans weight. Typically the giant panda has black eyes (like when a woman's eye make-up has run). Black ears and nose and a white head. The body is black around the fore legs then black again around the hind legs. They look large and cuddly but don't believe it - they can be dangerous just like other members of the bear family. The Giant Panda got its name as other panda bears are much smaller. For example the Red Panda, is much smaller and is fast and loves to live in and swing through trees similar to a Koala Bear.

Habitat

The Giant Panda is a very interesting animal because they can live up to the ages of twenty or thirty years in captivity. In the wild the Giant Panda can live up to ten or Twenty years. If you compare those ages together there are ten years in difference !

conclusion

Over all the Giant Panda is a magnificent animal in of the world, The Giant Panda is a special animal because of it's interesting habitat and appearance. If you don't try to save the Giant Panda the Giant Panda could become extinct and there will no longer be a Giant Panda.

Comment [3]: amatangi-hulls:
Gabby - you have worked towards your goal well and have clear paragraphs with main ideas and supporting detail. This is a big improvement on your first piece.

FANTASTIC WORK!!!
